Problem 1

PROBLEM:

Assume that $U \subset \mathbb{R}^n$ is an open set and $f : U \rightarrow \mathbb{R}$ is a differentiable function. Show that for every $k = 1, 2, \dots, n$, the partial derivative

$$\frac{\partial f}{\partial x_k} : U \rightarrow \mathbb{R}$$

is \mathcal{B}_n -measurable (here \mathcal{B}_n stands for the σ -algebra of Borel sets in \mathbb{R}^n).

PRELIMINARIES:

Definition 1. Let $\mathcal{S} \subset P(X)$ is a σ -algebra and $E \in \mathcal{S}$. The function $f : E \rightarrow \overline{\mathbb{R}}$ is called measurable relative to \mathcal{S} (i.e. \mathcal{S} -measurable) iff

$$\forall a \in \mathbb{R} f^{-1}(a, \infty] := \{x \in E : f(x) > a\} \in \mathcal{S}$$

Remark 1. Assume that $f : E \rightarrow \overline{\mathbb{R}}$, $E \in \mathcal{S} \subset P(X)$ is \mathcal{S} -measurable. Then the following are also \mathcal{S} -measurable

1. $f^2 : E \rightarrow \overline{\mathbb{R}}$
2. $|f| : E \rightarrow \overline{\mathbb{R}}$
3. $\frac{1}{f} : E \rightarrow \overline{\mathbb{R}}$
4. $a \cdot f : E \rightarrow \overline{\mathbb{R}}$, $a \in \mathbb{R}$

Definition 2. Let $U \subset \mathbb{R}^n$ and $f : U \rightarrow \mathbb{R}$ be a differentiable function. The partial derivative $\frac{\partial f}{\partial x_k}$ is defined as follows

$$\frac{\partial f}{\partial x_k} := \lim_{n \rightarrow \infty} \frac{f(x_1, \dots, x_k + 1/n, \dots, x_n) - f(x_1, \dots, x_k, \dots, x_n)}{1/n}$$

SOLUTION:

Let $U \subset \mathbb{R}^n$ and $f : U \rightarrow \mathbb{R}$ be a differentiable function. The partial derivative, $\frac{\partial f}{\partial x_k}$, can be increasingly estimated by the sequence of simple functions where for each borel-set region $(a, b) \in \mathcal{B}_n$ the simple function value of $[\frac{\partial f}{\partial x_k}]_{(a,b)}^i$ is defined by

$$\frac{f(a_1, \dots, a_k + 1/i, \dots, a_n) - f(a_1, \dots, a_k, \dots, a_n)}{1/i}$$

Since this simple function can approximate $\frac{\partial f}{\partial x_k} \forall k=1, \dots, n$, it is \mathcal{B}_n -measurable.

Problem 2

PROBLEM:

Let X be a space and $\mathcal{S} \subset \mathcal{P}(X)$ a σ -algebra in X . We say that the map $f : X \rightarrow \mathbb{R}^n$ is \mathcal{S} -measurable if and only if

$$\forall V \in \mathcal{B}_n, f^{-1}(V) \in \mathcal{S}$$

Assume that $f : X \rightarrow \mathbb{R}^n$ is a map that for all $v \in \mathbb{R}^n$ the function $\phi_y(x) := f(x) \bullet v, x \in X$, is \mathcal{S} -measurable. Show that the map f is \mathcal{S} -measurable.

SOLUTION:

In order for $\phi_y(x)$ to be measurable each dimension of the dot product must be measurable. (i.e)

$$\phi_y(x) = f_1(x) \cdot v_1 + \cdots + f_n(x) \cdot v_n \text{ measurable} \implies f_i(x) \text{ measurable } \forall_{i=1 \rightarrow n}$$

we now know that each dimension measurable in \mathcal{B} , therefore f is measurable in \mathcal{B}_n .

Problem 3

PROBLEM:

Let X be a bounded set in Banach space \mathcal{E} . We define the following function $\mu^* : \mathcal{P}(X) \rightarrow \mathbb{R}$ by

$$\mu^*(A) := \inf \left\{ r > 0 : \exists_{x_1, x_2, \dots, x_k \in X} A \subset \bigcup_{j=1}^k B_r(x_j) \right\}, A \subset X$$

where $B_r(x_0) := \{x \in \mathcal{E} : \|x - x_0\| < r\}$. Verify if the function μ^* is an outer measure on X and if it is check if it is a metric outer measure.

(The function μ^* defined above is called a *measure of non-compactness*. Can you guess what would be μ^* if $\mathcal{E} = \mathbb{R}^n$?)

PRELIMINARIES:

Definition 3. *Outer Measure*

SOLUTION:

Problem 4

PROBLEM:

For two given spaces X and Y and assume that $\mu_1^* : \mathcal{P}(X) \rightarrow \overline{\mathbb{R}}$ and $\mu_2^* : \mathcal{P}(Y) \rightarrow \overline{\mathbb{R}}$ are two outer measures. Define the function $\nu^* : \mathcal{P}(X \times Y) \rightarrow \overline{\mathbb{R}}$ by

$$\nu^*(C) := \inf \left\{ \sum_{k=1}^{\infty} \mu_1^*(A_k) \mu_2^*(B_k) : C \subset \bigcup_{k=1}^{\infty} A_k \times B_k, A_k \subset X, B_k \subset Y \right\}$$

Check if the function ν^* is an outer measure on $X \times Y$.

PRELIMINARIES:

SOLUTION:

Problem 5

PROBLEM:

A set $I \subset \mathbb{R}^n$ is called an *interval* in \mathbb{R}^n if there exists $a_1 \leq b_1, a_2 \leq b_2, \dots, a_n \leq b_n$ such that

$$(a_1, b_1) \times (a_2, b_2) \times \dots \times (a_n, b_n) \subset I \subset [a_1, b_1] \times [a_2, b_2] \times \dots \times [a_n, b_n]$$

We denote by \mathcal{F} the family of all intervals in \mathbb{R}^n . Consider the set

$$X := [c_1, d_1] \times [c_2, d_2] \times \dots \times [c_n, d_n], \quad c_k < d_k$$

Is the family $\mathcal{R} \subset \mathcal{P}(X)$, given by

$$\mathcal{R} := \{A \subset X : \exists_{I_1, I_2, \dots, I_N \in \mathcal{F}} A := \bigcup_{k=1}^N I_k, I_k \subset X\}$$

and algebra of sets in X ? Justify your answer.

SOLUTION:

This does form an algebra
